Wordcount casus

Data

A text file with 4255 wikipedia urls

Objective

Using python, implement a way to (efficiently) count the number of times each unique word (token) occurs in all pages these urls refer to.

The main objective is to show how you would approach a problem like this, and to give an example of your python coding. So please include a short description of your reasoning, why you chose a certain setup or approach.

Deliverables

- Your python code
- Your short description
